

Refrigerant Troubleshooting

How do I know if my air conditioning system is low on freon?

There are a symptoms that may point to your system being low on freon. Your system may run and cool but it may not cool as well as it used too. It may be buildig ice on the indoor coil and outside coil. If ice is found see the "[What is freezing up?](#)" Faq. Also if your system is extremely low on freon it may not be cooling at all. If your system does turn out to be low on freon this means your system has a freon leak in it somewhere. The best thing to do is have a service technician come out and check your system.
